```
The present sequence represents a probe which is used to detect the mutation S55C in the human histocompatibility iron loading (HFE) protein. The HFE gene is a major histocompatibility (MHC) non-classical class I gene located on chromosome 6p. Mutations in the gene lead to iron disorders. The specification describes a method for diagnosing an iron disorder or a genetic susceptibility to develop the disorder in a mammal. The method comprises determining the presence of a mutation in exon 2 or an intron of a HFE gene or protein. The mutation is not a C for 6 missense mutation at nucleotide 187 of the sequence given in A96769 (Genbank Accession number 160319). The presence of the mutation indicates the disorder or the genetic susceptibility to the disorder. The method is used to diagnose an iron disorder e.g. haemochromatosis, or a genetic susceptibility to develop it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               31-OCT-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Thomas WJ,
```

as

The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed a having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for

```
The present sequence represents a fragment of the gene to which probe ABL539 hybridises. This probe was used to detect the mutation H63D, which is responsible for hemochromatosis. The probe is used to demonstrate the method of the invention. The specification describes a method for detecting a mutation at position in a target nucleic acid by solid phase amplification process. The region of interest is amplified on at least two separate supports (A, B) using at least one primer linked, at its 5'-end, to the supports. The DNA strands are then separated and strands in the suspension removed by washing. Bound DNA sequences are hybridized to a probe, the 3'-end of which hybridizes up to, at most, position n-1. The probe is elongated by BOLYMERTS and an uncleotides in the 5' to 3' direction, using a DNA polymerase and a nucleotides in the 5' to 3' direction, using a DNA polymerase and a nucleotide derivative (durr*) that is resistant to exonuclease. The dNTP* used is complementary to the mutation for support A but to the wild type for supports are not degraded by dNTP* are not degraded. The supports are then washed and non-degraded probes detected inflictily. The method is used to detect mutations associated with an exonuclease, especially haemochromatosis; sickle-cell anaemia; alpha or beta-thalassemia; cystic fibrosis; haemophilia; neurodegeneration and entire mentific region and for detering and/or identifying gene or an entire mentific region and for detering and/or identifying appears and an entire mentifically
alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mutation; solid phase amplification; haemochromatosis; cancer; sickle-cell anaemia; beta-thalassemia; alpha-thalassemia; polymorphism; cystic fibrosis; haemophilia; neurodegeneration; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   entire genetic region and for detecting and/or identifying genetically modified organisms.

                                                                                                              0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a new probe for analysing a target nucleic acid comprising of a fluorescent detecting entity consisting of a single-labelled oligonucleotide having a sequence complementary to a locus of the target nucleic acid and a fluorescent label linked to an internal residue of the oligonucleotide. The probe is useful in melting curve analysis, agencypting, detecting pathogens such as Salmonella, and in biological sample. This polynucleotide sequence represence in a biological sample. This polynucleotide sequence represents a probe target of the invention for melting analysis of haemochromatosis-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                  Human probe target HHDT1 of haemochromatosis-associated mutation C187G.

The specification describes a method for detecting a mutation at a particular position in a target nucleic acid. The method comprises binding the target to a solid support, hybridizing a probe to the target, elongating the probe with howelecchide(s) resistant to exonuclease, digesting the probe with exonuclease and detecting bound nucleic acid. The mutation is in position "" in a target nucleic acid and the 3' extremity of the probe hybridises to position "". The method is used to detect gene mutations implicated in disease, particularly hereditary genetic diseases, especially sickle cell anneals, alpha and beta thalassemias, cystic fibrosis, hemophilia and genes implicated in cancer. The present sequence represents a DNA fragment which comprises a mutation which is implicated in hemochematosis. The mutation is detected using the method of the
       Detecting mutation in target nucleic acid, useful for detecting hereditary genetic diseases, comprises using chip whose electrical or optical property changes relative to the presence of hybridized probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on a single surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;
                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

The present invention provides a database of human samples obtained from healthy individuals which can be used to identify polymorphic genetic markers. Data obtained for the database can be used to sort the samples by parameters such as age, sex and ethnicity. This is useful in linking markers with diseases, susceptibility to infection and drug responses. The present sequence was used in an assay to demonstrate the uses of the database of the invention.
                                                                                                            polymorphism; SNP; human; genetic marker; djsease; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; antiarthritic; antirheumatic; antiproliferative; vasotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; fungicide; ophthalmological; cytostatic; immunosuppressive; nootropic; neuroprotective; antiallergic; hepatotropic; antidiabetic; antiincer; vulnerary; anticonvulsant; antibacterial; antiparasitic; cardiant; gene therapy; cancer; immune disorder; cardiovascular disorder; neurological disease; infection; human; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               6
                                                                                                                 The Invention relates to immune, porty, western the concided proteins (AAM434497-AAM43660) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes were isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial isohaemias, (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and
                                                                                                           The invention relates to human polynucleotides (AAI63803-AAI64012) and
                                                                                                                                                                                                                                                                           (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasittic infections.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     iron absorption regulator; intracellular iron absorption; lung injury; haemochromatosis; transfusion; thalassaemia; haemolytic anaemia; chronic infection; transferrin receptor; TfR; brain tumour; cancer; oxidative stress disorder; tissue damage; vascular disease; inflammation; atherosclerosis; autoimmune disease; inflammatory condition; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                       New isolated nucleic acids and polypeptides, useful for diagnosing, treating and/or preventing human diseases and disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           beta 2 microglobulin; beta2M/HFE monochain; HFE; ischaemia;

thalassaemias, haemolytic anaemia or chronic infections, and for delivering a therapeutic to cells that over-express transferrin receptor (TfR) which are preferably lymphocytes or leukocytes, across the bloodbrah brain bearier. (I) is further useful for treating brain tumour. (I) is also useful for treating oxidative stress disorders resulting in tissue of tissue damage e.g. vascular diseases, inflammation, atherosclerosis, under injury, ischaemia, etc. A DNA molecule (II) encoding (I) is useful as a platform for drug delivery of therapeutic use for cancer, arother decases and inflammatory conditions. The monochain manifests specific characteristics advantageous for drug delivery systems. It is a soluble, stable and fully conformed protein. It binds specifically to transferrin receptor (TfR) and therefore targets cells that over-express this receptor. It is continuously internalised by the target cells, thus enabling efficient drug delivery. It dissociates from the receptor in the cells, in inimising side effects. It negatively regulates iron absorption, reducing growth of undesired cells and preventing lymphocyte activation.

It is not diluted in the blood as is transferrin. It should not induce an immune response since it is a self non-polymentic protein and delivery of annochain is a self non-polymentic protein and delivery of annochain.

This cDNA clone, designated cDNA24, is derived from human gene whose mutated form is associated with hereditary haemochromatosis (HH). It was obtained from a directionally cloned plasmid-based CDNA library following identification of the HH locus in the HLA region of chromosome 6. A single mutation (24d1) in the HH gene appears responsible for the majority of HH disease. This comprises a G to A substitution that is present in 86% of affected chromosomes and in 4% of unaffected chromosomes. It results in a chromosomes and in 4% of unaffected chromosomes. It results in a critical disulphide bridge important for secondary structure. The critical disulphide bridge important for secondary structure. The AAP96690, the H437 bp CDNA sequence (Ia) and thair 24d1, 24d2 and 24d7, variants; a clonding or expression vector; host cells; a peptide product chosen from the HH gene product, its variants (24d1, 24d2 and 24d7), or a peptide of at least 56 amino acid residues of these; an antibody produced using the peptide; a method conducts, T-cell differentiation factors and therapeutic agents for mutation; an annial madel for the HH disease; metal of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process on vivo or mitigation of injury due to oxidative process on vivo or mitigation of injury due to oxidative process on vivo or mitigation of injury due to oxidative process on vivo or mitigation of injury due to oxidative process or product of a nucleic acid sequence as above; and oligonucleotide directed against a transcriptional product of a nucleic acid sequence as above; and oligonucleotide sequence of a nucleic acid sequence of a nucleic acid sequence of a nucleic acid sequence of a nucleic acid sequence of a nucleic acid sequence of a nucleic acid sequence of a nucleic acid sequence of a nucleic acid sequence for the HH ho
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hereditary haemochromatosis gene and variants - useful for diagnosis and treatment of hereditary haemochromatosis disease
                                                                                                                                                           "G to A substitution (24d1 mutation
associated with HH), results in Cys to
Tyr substitution"
"C to G substitution (24d2 mutation) results in His to Asp substitution"

```

```
The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                             Wolff RK;

The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
